

What drives me in the most basic sense is to not only be the best that I can be but to help others achieve their own success. There are so many people in this world that are trapped below the poverty line and forced to live miserable lives by people that are only in it for themselves. Our government is falling apart, countries all around the world are oppressed by bad social reforms and unfortunate circumstances. This drives me to want to help them and go into politics and be that voice for change. I didn't come from a wealthy or well-off family that could give me everything I wanted, this is because I was raised by a single mom alongside two sisters. I love my family so much and I know what it's like for not only millions of Americans that are poor and just want a better life, but hundreds of millions of people around the globe. When I look at all these issues and see that they aren't genuinely getting better because the people we've elected to office are millionaires and care about as much for the lower class as they do for two cents in their pocket.

I don't only want to go into politics, but I want to help everyone and be an engineer. I like to solve problems it makes me happy to make others happy. I have always had this idea that in order to provide water to communities in Africa that you could make a special turbine, like a windsock, that would catch the wind turning a blade attached to a generator through a magnetic circuit. This generator would power a water condenser which would pull moisture from the already disturbed air going through the wind-water generator. The main issue with this would be getting the materials to build it and the funding to either transport it to where it needs to without damaging it so that way eventually everyone in the world can access its most important resource and, if properly sourced, one of its most abundant.

In the end, the same thing that drives me is the thing that drove some of our greatest people to society's biggest achievements; like Nikola Tesla and his pioneering work with electricity, among other things, Marie Curie with her work on radiology and science, and another of my heroes, or Humphry Davy, not as well-known as the others, but was still a superb chemist and inventor. All of these people came from different backgrounds and sources but were able to pull off the impossible and my greatest hope is that I can do as much as they did for society and the impact they have left on humanity and on me in particular. One day I might be someone that others look up to for inspiration to the future and even in their own Jiffy Lube Scholarship Application. Thank you for the opportunity to potentially win and prove myself to the world and myself.
